Reading

Good news may be on the way for people who hate doing the laundry – self-cleaning clothes. Scientists in China are developing a fabric that cleans itself under the sunlight. This could make washing clothes a thing of the past. Researchers at Shanghai's Jiao Tong University and Hubei University created a chemical that causes cotton materials to clean themselves under the sun. The chemical coating is made from titanium dioxide, which breaks down dirt and stains, and removes odours when placed under the sun.

You can see the whole lesson from your teacher, please ask them to send it to you before the class.
